The **Console Server (ACS)** configuration Cyclad provides **Console Access and Terminal** servers designed to allow local and distant access for in-band and out-of-band network management.

However, after the CCGs' 15-line of console, however, the AGC has the following enhanced features:

485 CMMA slots that support standard interface cards (Ethernet, Modem, and wireless LAN).

- Optional dual entry redundant power supply (CPOC) for extra reliability.
- Secure clustering for up to 1024 devices, SSH v2, RADIUS authentication, IPSec, IP filtering, and user access lists per port.

- Console management supports Windows Server 2003 EMS protocols.

- Data buffering, Event notification, and a selection of direct access methods to serial ports.

The Alterpath ACS is available in 1, 4, 8, 16, 32 and 48-port models that fit in 1U of rack space. As with most Cyclades products, the ACS runs an embedded version of the Linux operating system.
