1400-2000 euros, price depends on component selection.

Hi, I just built this PC. I really enjoyed the process of making it look 'presentable' and would like to do it again so I'm selling it. Nothing wrong with it, every component is straight out of a new box and can be tested in front of you, maybe in video call if you live far away. Before I give a run down of the specs, some of these components are optional and I would happily replace them for a component you would prefer, this can reduce price significantly.

The specs of this PC are top of the line and were not designed for a single purpose, it would perform outstandingly in all the tasks from gaming to running simulations and programing to video editing. Windows 11 PRO. Newest generation cpu, ram, ssd, coolers, motherboard, and great GPU (30 series not latest but can run any game at high speed).

The specs can be found in one of the pictures with their price, the total cost of the components of the PC is 1920 euros. I will sell it for 2000 for those specs + mouse and keyboard. Will make almost no profit so this is not for negotiation. However, I am willing to remove/replace certain components to make it cheaper.

The AIO CPU cooler is the NZXT z53 RGB, this liquid cooler is distinguishable by its ability to have a dynamic display. As shown in the pictures it is mostly used to display the GPU, CPU, and cooling liquid

temperatures, but this can be changed to any image/gif. As you can see from the picture, it costs 270, this can be removed as I have a spare that I can use to perform the same task. Compared to the other cooler options, it is the most reliable and has the most display options. There are also other liquid coolers, but they are not as reliable, and they are not as cheap, and they are not as good as the CPU cooler. You can also use a regular CPU cooler, but it is not as reliable, and it is not as cheap. I am willing to remove/replace certain components to make it cheaper. I am willing to remove/replace certain components to make it cheaper. I am willing to remove/replace certain components to make it cheaper.

The GPU is an Asus RTX 3060 Ti 8GB GDDR6X. Very good graphics card. However, if you are not using this PC for gaming or design work then this can be removed. This would reduce the cost by almost 400 euros. Although the CPU has its own integrated GPU, I can offer you a used i7 1050Ti for 100 euros (I can run tests to show performance). This would also change your power supply from the 750 to the 550. Since the 550 is also used, it will reduce the cost of the power supply. The i7 1050Ti 10gb is a good

---

enough card for running most games anyways.

If you don't need 32 gb's of ram (or would like more) this can be arranged, same goes for the storage. If you have other requests we can discuss.

I will hand you the warranties to the components, if you don't trust my build you can take it straight to a PC shop and ask them to check it.

If you would like to get your own components I can build them for you almost free of charge. If you have a specific purpose for the PC we can make a new set up.

This cost does not include delivery, you will be responsible for any delivery.
