-
- Each panel of the leading edge has a reinforced LE seam with an extra layer of heavy duty dacron. This makes up for four total dacron layers on the seam in horizontal direction. This reinforcement does not cross the vertical seams, as these already have four layers of dacron which save weight and creates even load distribution on all leading edge seams.
 - We are extremely proud to have over 98% of our product packaging from recycled paper. In the last few years we have been working hard on this and have replaced almost all plastic packaging with paper. All kites and boards have zero plastic packaging and come in recyclable boxes.
 - The Airlock valve brings easy and quick inflation & deflation of the kite. For added convenience the pump hose connects under the valve with a simple half twist motion and stays securely connected during the whole inflation process.
 - The Infinity kite construction was streamlined to achieve the lowest possible weight, while keeping the kite rigid and responsive. Despite its light weight, the Infinity has a crisp Triplex triple ripstop canopy. We reduced the number of Arptex shields on the leading edge and narrowed down their total area covered to save weight. We joint as many panels together as possible for further weight saving, as every seam creates extra weight, because of overlapping materials, double sided tape inside the seam and extra thread. Thanks to the lightweight construction, the two strut Inifinity kite is in the weight range of one strut kites.
 - We moved the back lines attach points directly to the leading edge of the kite. The new attach point position puts less pressure on the canopy and creates a much more direct response and faster turning of the.
